THE ALGORITHM

Genetic Algorithm is a type of local search that mimics evolution by taking a population of **strings** which encode possible solutions and combines them based on a **fitness function** to produce individuals that are more fit.

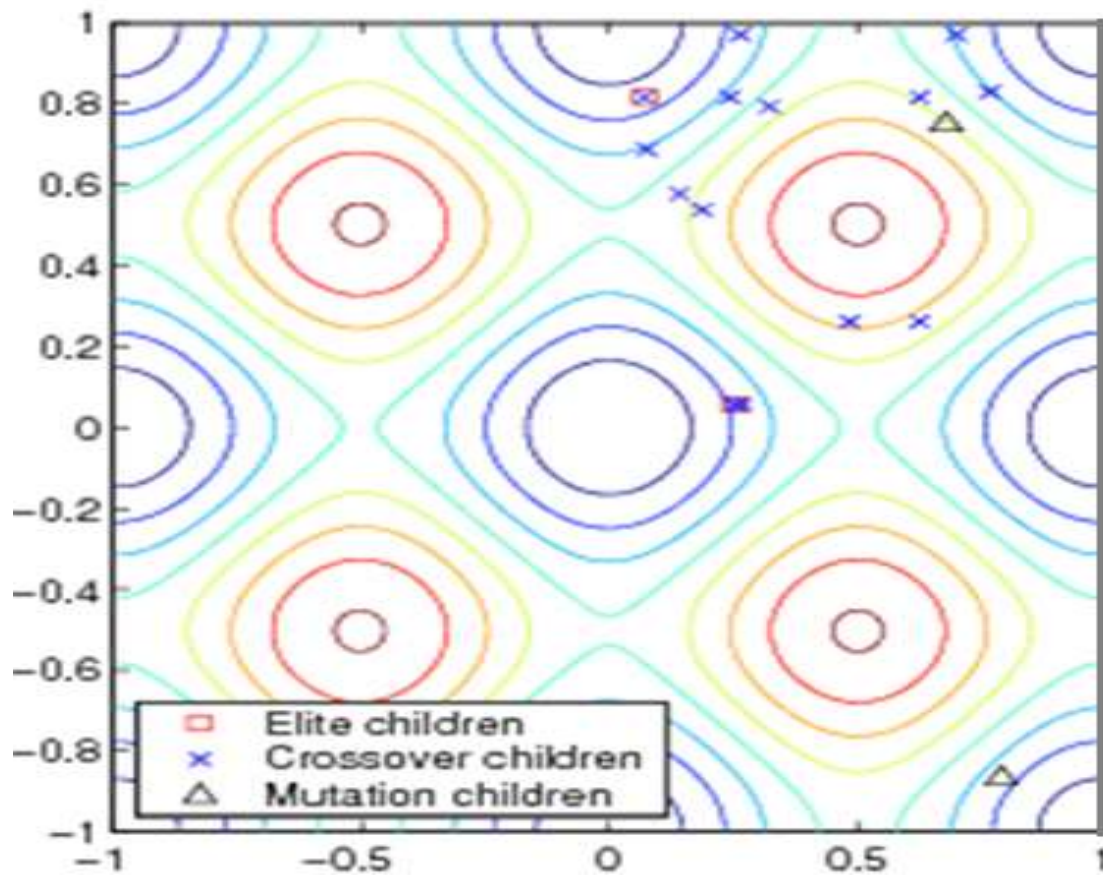

FOR INSTANCE

- 1) Encoding the two numbers into binary strings
Parent 1=3.273672 =>11.0100011000001
Parent 2=3.173294 =>11.0010110001011
- 2) Randomly choose a crossover point; let suppose be it at bit 6, and we split the gene at position six.
Parent 1=>3.273672=>11.010---0011000001
Parent 2=>3.173294=>11.001---0110001011
- 3) Swapping the two tails ends of binary strings.
Child 1=>11.010---0110001011
Child 2=>11.001---0011000001
- 4) Recombining the two binary strings to get two new offspring.
Child 1=>11.0100110001011
Child 2=>11.0010011000001
- 5) Decoding the binary strings back into floating point numbers.
Child 1=3.298218
Child 2=3.148560

WALKING THROUGH GENERATIONS

Zeroth Generation

First Generation

60th Generation

95th Generation

100th Generation

REAL WORLD USES

- ◉ Artificial Intelligence
- ◉ Automotive Design
- ◉ Computer Gaming
- ◉ Predicting Protein Structure
- ◉ Optimization Problems
- ◉ Music
- ◉ Business

BIOLOGY AND CHEMISTRY

Helps to determine the accurate torsion angles and predict protein structure

Optimization of aerodynamics of a Car for a smooth drive on a crooked path

20 fps average
Physics step: 5 ms (101 fps)
12 MB used

Generation 100

#0 : 50.9
#1 : 0.4
#2 : 164.2
#3 : 267.2

Score: 5.5 (534.5)

Mutation Rate: 1 %

FEATURES

ADVANTAGES

- ◉ No training required
- ◉ Efficient even during Multi-modal or n-dimensional search space
- ◉ Can work for non-linear equations too
- ◉ Efficient

LIMITATIONS

- ◉ Do not work well when the population size is small and the rate of change is too high.
- ◉ If the fitness function is chosen poorly or defined vaguely, the Genetic Algorithm may be unable to find a solution to the problem, or may end up solving the wrong problem

GA SOFTWARES

- ◉ **GAOT**- Genetic Algorithm Optimization Toolbox in Matlab
- ◉ **JGAP** is a Genetic Algorithms and Genetic Programming component provided as a Java framework
- ◉ **Generator** is another popular and powerful software running on Microsoft Excel

CONCLUSION

- ◉ Genetic Algorithm is related to “solving problems of everyday interest” in many diverse fields.
- ◉ However, several improvements can be made in order that Genetic Algorithm could be more generally applicable. Future work will continue through evolution and many more specific tasks
